Dear Hiring Manager,

I am interested in Senior Platform Engineer and Senior DevOps Engineer opportunities with your team. My work combines production infrastructure, deployment automation, and internal tools that help engineering teams request and use cloud resources.

At Tamara, I worked as a Senior DevOps Engineer from January 2021 to March 2023, then as a Senior Platform Engineer from April 2023 to February 2025. In the platform role, I connected Backstage with Terraform to automate requests for Redis, MySQL, and PostgreSQL resources, and used n8n with Jira for internal support workflows.

I also created more than 40 MySQL clusters in GCP and migrated data from OCI using GTID replication, IPsec VPN tunnels, and GCP external replication. The migration was completed in one day using gcloud and OCI CLI scripts. I set up MySQL and PostgreSQL replicas for CDC pipelines into Google BigQuery to support business and analytics teams.

In my earlier DevOps role at Tamara, I designed and operated 18 production Kubernetes clusters across GCP, OCI, and AWS, supporting 75 services and 250 engineers. Workloads reached up to 150,000 requests per minute under a 99.95% SLA. Moving deployments to Argo Rollouts canary releases with GitLab CI/CD and GitOps helped increase deployment frequency by 150% to more than 25 releases per week.

My earlier infrastructure and Tier-3 support work covered Linux, networking, storage, and incident response. My certifications include Certified Kubernetes Administrator (CKA) and AWS Certified Solutions Architect - Associate.

I am based in San Diego, California, and am eligible for full-time CPT employment in the United States. I would welcome a conversation about how I could support your platform and engineering teams. Thank you for considering my application.

Sincerely,

Nguyen Ngoc Linh
